

LIQUID CRYSTAL DISPLAY DEVICE AND  
METHOD OF FABRICATING THE SAME

5

ABSTRACT OF THE DISCLOSURE

10       When radiating light onto a liquid crystal  
composition containing a photosensitive material, the  
alignment of liquid crystal molecules is adjusted by  
applying a voltage to the liquid crystal composition  
layer, to achieve substantially orderly alignment of the  
15       liquid crystal molecules, or the alignment of the liquid  
crystal molecules is made uniform by adjusting the  
structure of the liquid crystal display device, or any  
display defect is driven out of the display area. When  
radiating light to the liquid crystal composition  
20       containing the photosensitive material, the alignment of  
the liquid crystal molecules can be adjusted so as to  
achieve substantially orderly alignment of the liquid  
crystal molecules, and the liquid crystal display device  
can thus be driven stably.
